Idea 1: A running app that creates routes for runners who want to run specific distances in their areas. It takes the user through the safest route based on datasets from the city of Boston which give us information on areas with a high concentration of car accidents as well as high crime rate areas. The program then avoids those areas and delivers a route to the user. Other features include creating routes that are the length of Spotify playlists that the user selects based on the latter's age, height, weight, and past as to find the average speed of that person.

Idea 2: An app that allows users to have virtual tours of any place in the world! Half the web app will be a google map where the user can drag around and find a location they are interested in visiting. On the other half of the web page will be YouTube. Whatever the google map is pointed at, that location will be input into the YouTube search box plus "tourism" to allow users to see where they wanna go in real videos!
